

Two Player Switch [Movement, Variables, Branches]

Create a door which the player can only be used if two buttons have been pressed which only a single character can reach.

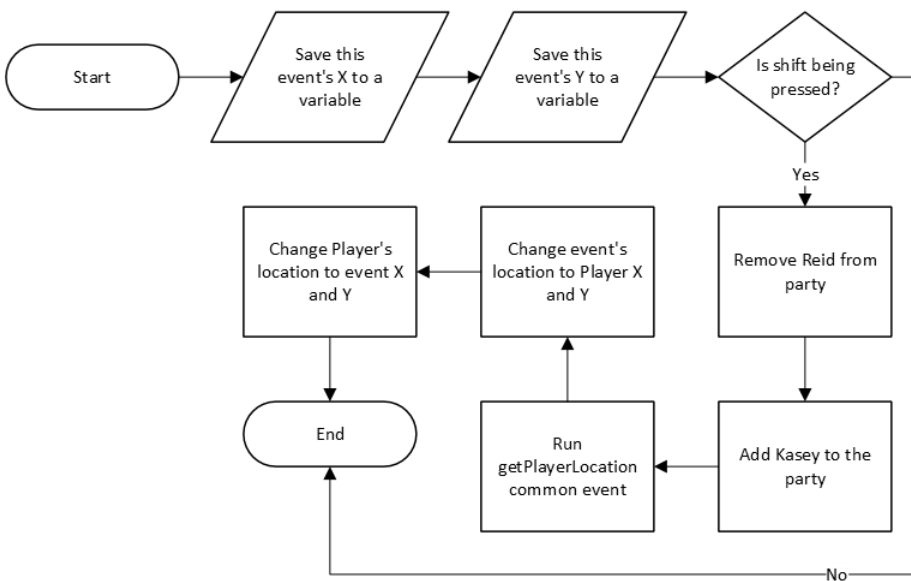

The first thing to do is create a room split into two sides, with the exit being blocked by something such as a boulder.

Following this flow chart, create a common event that saves the players' location:

Then follow this flow chart to create the Player 2 event which will allow the player to control another character. Set the condition for the first page to be that Reid is in the party. Add a second page with Kasey being in the party that is the same as the first page but removes Kasey and adds Reid. Swap the event's image to be Reid's sprite.

Now that the biggest challenge is implemented, all that's left is setting up a simple puzzle. For the buttons, have one set switch 1 on, and have the other button turn switch 2 on. As for the boulder, follow this simple flowchart:
