

Return Stone [Movement, Item, Branches, Switches]

Create an Item that players can interact with to teleport back to specific places they've visited before.

Start by creating the Return Stone item. For my first two maps I like to do the outside of my player's home, and the inside as the second map. On the first map (the outside), create a Door event as shown below. On the inside map, create an "exit" event.

Create: Comon Event

Name	Return Stone
Switch	#0001
Trigger	Parallel

Create: Item

Name	Return Stone
Consum.	No
Occasion	Menu Screen
Type	Effect
Scope	All Allies
Effect	Common event Return Stone

Create: Map Event

Name	Home
Priority	Below Player
Trigger	Player Touch
Page	1
Condition	None

Create: Map Event

Name	Home
Priority	Below Player
Trigger	Player Touch
Page	2
Condition	Self-Switch A

Follow the flow chart on the **RIGHT** to "register" a new location into the list of available return options:

Switches	
[0001 - 0020]	
0001	OFF
0002	homeActive
0003	
0004	
0005	
0006	
0007	
0008	
0009	
0010	
0011	
0012	
0013	

Follow the flow chart on the **LEFT** to create the basic structure for the Return Stone common event. This is what will actually let you interact with the Return Stone Item.

Don't forget that these are just base line foundations. You can easily duplicate and rename them to create multiple return locations. Just remember these few key details. 1. Each location needs its own unique switch. If they all use the same switch the player would gain access to all the locations, you created. 2. It is useful to name each location's switch, so that you don't end up linking multiple locations to the same switch. 3. Set the Return Stone common event's switch to one that is never activated, or you'll be constantly prompted with the activation and teleportation prompt.
