

Callback API

The signature is `parse(data, [options], callback)`.

The [callback example](#) takes the CSV string in the first argument (`input`), options in the second argument, and a user callback in the third argument. The callback receives any error thrown by the CSV parser in the first parameter (`err`), or an array of records in the second argument (`output`). It returns an array.

```
import assert from "node:assert";
import dedent from "dedent";
import { parse } from "csv-parse";

parse(
  dedent`
    # Welcome
    "1","2","3","4"
    "a","b","c","d"
  `,
  {
    comment: "#",
  },
  function (err, records) {
    assert.deepStrictEqual(records, [
      ["1", "2", "3", "4"],
      ["a", "b", "c", "d"],
    ]);
  },
);
```
